

BOT CHAIN ECOSYSTEM SUPPORT PROGRAM

Any handle is a **wallet**.

Selkie pays people who have never installed a wallet. The payment itself creates their account – so agents, apps and communities can pay a human by name, in one line.

send 5 CC to @ada

THE PROBLEM

Agents can't onboard humans.

Every system that needs to pay a person – an AI agent settling a bounty, a protocol running rewards, a community paying contributors – hits the same wall. The recipient has no wallet, and nothing can walk them through creating one.

WALL ONE**The claim step**

Install a wallet. Write down twelve words. Buy gas. Paste a forty-character address you cannot read. Most people quit here – and 20–40% of all reward and airdrop value is never collected as a result.

WALL TWO**Gas economics**

Social payments are small payments. On most chains a \$0.50 tip costs more in fees than it delivers, so consumer payments have never worked at scale – the economics forbid it before the UX even matters.

WALL THREE**No addressing layer**

Autonomous agents can transact with contracts, but they cannot resolve "pay this person." There is no identity-addressed payment rail between agents and the humans who do work for them.

An agent economy that cannot pay people is not an economy.

THE SOLUTION

The payment creates the wallet.

```
send 5 CC to @ada
```

One line, sent to a bot. @ada has never heard of Selkie.

1

A handle is named

No address, no lookup, no invite. The recipient is identified the same way people already identify each other.

2

Account opens mid-transfer

If the handle has no account, one is created inside the same atomic transaction that pays it. A rollback leaves no orphan.

3

The money is simply there

Nothing to claim, install, or sign. They sign in later with the handle they already own and the balance is waiting.

THREE SURFACES, ONE CORE

Payments where people already talk.

ON X**Pay from the timeline**

Reply to @SelkiePay in any post. Selkie settles it and replies with a receipt. Every payment is a public mention of a wallet that did not exist before.

send 5 CC to @ada

ON TELEGRAM**Pay from a chat**

Open @selkiepay_bot and tap start. Your Telegram username is the wallet, with a button menu for people who never type commands.

send 10 USDCx to @ada

ON THE WEB**The full wallet**

Sign in with X for balances, sends, requests, activity, bulk campaigns and a shareable pay-page for any handle.

selkiepay.vercel.app

All three route through a single dispatch layer, so a fourth surface – or an agent-facing API – is a driver, not a rewrite.

PROVEN, NOT PROMISED

Everything here is already running.

20 / 20 paid • 0 unclaimed

A 20-winner reward campaign settled on a real public node. 20 wallets created, every recipient had no wallet before the payment landed.

111 automated tests

Run against a live participant node, including a 12-test integration suite that exercises real settlement end to end.

1.9 cBTC • 5.5 cETH

Real tokenised assets accepted through the CIP-56 token standard, held at external registrars – verified by live ledger query on 4 Aug 2026.

81 contracts • 16 accounts

Live on DevNet now, each account at its own distinct party. Three surfaces in production – a reviewer can pay a handle in under 60 seconds, installing nothing.

Live on Canton DevNet • no mocks

Built at HackCanton Season 2

Open source • github.com/martinvibes/Selkie

WHY BOT CHAIN

The first chain where this is economically possible.

FEES

Sub-dollar payments finally clear

Near-zero fees and 0.75s blocks are the first economics under which a \$0.50 tip or a \$2 bounty makes sense. This is the constraint that has blocked consumer crypto payments everywhere else.

THESIS

Agents need a human payout rail

BOT Chain is building settlement for autonomous agents. Selkie is the last mile from those agents to actual people – the piece that makes agent-to-human payment a category that can exist.

FIT

EVM means weeks, not quarters

Our on-chain surface is six contracts. EVM compatibility means the port is a focused Solidity implementation against a spec we have already proven in production, not a rebuild.

WHAT THE PORT ACTUALLY COSTS

The hard part is already done.

X bot · Telegram bot · Web wallet

PORTS UNCHANGED

Dispatch core – one shared command parser

PORTS UNCHANGED

Handle resolution, custody, sessions, campaigns

PORTS UNCHANGED

6 contracts – 307 lines

REWRITE IN SOLIDITY

Selkie's on-chain surface is deliberately small: **307 lines across six contracts** – Account, Holding, Transfer, Request, Escrow, Rewards.

Everything above it is chain-agnostic Node.js and React. A native BOT Chain deployment is a focused Solidity implementation of six contracts whose semantics are already specified and proven against real settlement.

We are not asking for funding to find product-market fit. We are asking for support to bring a working product to a chain that fits it.

WHO THIS IS FOR

Two markets, one primitive.

MARKET ONE

Agent & protocol payouts

Task bounties, data labelling, RLHF work, referral splits, community rewards. Anywhere software must pay a human, the recipient's missing wallet is the bottleneck. One API call with a handle removes it.

Distribution is the payment itself: every payout publicly names a wallet that did not exist a second earlier.

MARKET TWO

Emerging-market consumer payments

Nigeria first. Our users do not own hardware wallets – they own a phone and a social handle, and that is the entire account model.

They are reached as recipients, not as signups: a community manager paying 20-50 contributors brings 20-50 funded wallets at zero acquisition cost, all of whom arrive already holding a balance.

The same contract serves an agent paying a worker and a person paying a friend.

THE ASK

Option C – Community Growth Support

Selkie has no token, so DEX liquidity and CEX listing support do not apply. Community growth is both the tier we qualify for and the metric we are built to move: every payment Selkie settles creates a new funded user.

1**Deploy natively**

Six contracts in Solidity on BOT Chain mainnet, with BOT Chain as the default settlement rail for every new Selkie user.

2**Open the agent API**

A public pay-by-handle endpoint so any agent on BOT Chain can settle to a human without touching wallet onboarding.

3**Grow by payout**

Land through campaign runners and agent operators, whose payouts each bring cohorts of new funded BOT Chain wallets.

Gas rebates matter disproportionately here: our transaction profile is high-count and low-value, which is exactly the shape that rebates make sustainable.

TRY IT BEFORE YOU DECIDE

You can pay a handle in the next **sixty seconds**.

No install, no seed phrase, no test tokens to request. Reply to the X bot or message the Telegram bot and watch a wallet come into existence.
