

On-chain Interaction Records

Live ledger state queried 4 August 2026 · Canton Network DevNet · prepared for the BOT Chain Ecosystem Support & Incentive Program

SCOPE – PLEASE READ FIRST

Selkie has not yet deployed to BOT Chain, and therefore has no BOT Chain on-chain history. This application is a request to deploy natively. The records below are Selkie's existing settlement history on the Canton Network DevNet, provided as evidence of a working on-chain product rather than as BOT Chain activity. We state this explicitly rather than omit it.

1 • How to verify this

Canton is a privacy-preserving ledger: contracts are visible only to their stakeholders, so there is no public block explorer that can display a third party's holdings, and no Dune dashboard is possible. Verification is done by querying the participant node directly with credentials for the party in question. Everything in this document was produced by such a query, executed read-only against the live shared DevNet participant on the date shown.

Network	Canton Network DevNet (shared HackCanton participant, Canton 3.5.9)
Participant node	ledger-api-json.participant.hackcanton-01.devnet.naas.noders.services
Selkie operator party	c699b723-4b03-42ef-98e8-244465658339::122003aa7c491e00a453145c4d2cd3dbf5db8908b4e663c9944baed57fd66effa668
Package ID	49a123170adb07f7fee0ee70d30395d1a40336be53a7228cd4d1b1df50ed5f83
Ledger offset at query	511565
Queried	2026-08-04T10:31:37Z

2 • Live position summary

81 active contracts are held at Selkie's operator party. The two categories below are distinct and should not be added together: **token-standard holdings** are real assets held at an external registrar under CIP-56, while **internal holdings** are Selkie's own ledger model tracking per-user balances.

TOKEN-STANDARD HOLDING (CIP-56)	REGISTRAR	AMOUNT
cBTC	cbtc-network::12202a83c6f4...	1.9000000000
cETH	rails-cethMain-1-dev::12200b6de0...	5.5000000000

CONTRACT TYPE AT OPERATOR PARTY	COUNT
Selkie.Holding	53
Selkie.Account	16
Utility.Registry ExecutedTransfer	4
Utility.Registry Holding	2
Splice.Amulet (FeaturedAppRight, ValidatorRight, Amulet)	4
Selkie.AccountDirectory	1
Other (WalletAppInstall, DamlLens)	2
Total active contracts	81

3 • Accounts on ledger, each at its own party

16 **Selkie.Account** contracts are live, and each resolves to a **distinct Canton party** – not an omnibus balance row. This demonstrates the per-user account model operating on a shared network we do not administer.

Stated honestly: these are a mixture of real users and demonstration handles created during development and judging. They are presented here as *on-chain account records*, which is what this field asks for, and are not offered as a count of independent active users.

HANDLE	DISTINCT ON-LEDGER PARTY	HANDLE	DISTINCT ON-LEDGER PARTY
@martin_vibes	selkie-pool-01	@selkiepay	selkie-pool-10
@oxgenzero	selkie-pool-02	@bayo	selkie-pool-11
@kira	selkie-pool-04	@0xgents	selkie-pool-14
@martin_tech21	selkie-pool-06	@paymesh_	selkie-pool-17
@tg_check	selkie-pool-08	@nickyhodl	selkie-pool-18
@vestor_d3v	selkie-pool-09	@ada	selkie-x-ada
@cleo	selkie-x-cleo	@theo	selkie-x-theo
@mira	selkie-x-mira	(unnamed)	–

4 • Settled token-standard transfers

Four **ExecutedTransfer** records are retained at Selkie's party. These are CIP-56 token-standard settlements involving external registrars – assets genuinely moved across organisational boundaries, not internal bookkeeping.

DIRECTION	COUNTERPARTY	ASSET	AMOUNT
Inbound	rails-cethMain-1-dev (registrar)	cETH	5.0000000000
Inbound	rails-cethMain-1-dev (registrar)	cETH	5.0000000000
Outbound	selkie-pool-10 (a user party)	cETH	3.0000000000
Inbound	cbtc-network (registrar)	cBTC	see §2

WHY THE OUTBOUND RECORD MATTERS

The third row is Selkie sending **3.0 cETH from the operator party to a user's own party** through the token standard. It demonstrates the complete path – external registrar into Selkie, then Selkie out to an individual user account – rather than assets merely sitting where a faucet left them.

5 • Raw ledger record (verbatim)

A single token-standard holding contract, exactly as returned by the participant node:

```
{
  "operator": "auth0_007c65f857f1c3d599cb6df73775::1220d2d732d042c281cee80f483ab80f3cbaa4782860ed5f4dc228ab03dedd2ee8f9",
  "provider": "cbtc-network::12202a83c6f4082217c175e29bc53da5f2703ba2675778ab99217a5a881a949203ff",
  "registrar": "cbtc-network::12202a83c6f4082217c175e29bc53da5f2703ba2675778ab99217a5a881a949203ff",
  "owner": "c699b723-4b03-42ef-98e8-244465658339::122003aa7c491e00a453145c4d2cd3dbf5db8908b4e663c9944baed57fd66effa668",
  "instrument": { "source": "cbtc-network::12202a83c6f40822...", "id": "CBTC", "scheme": "RegistrarInternalScheme" },
  "label": "",
  "amount": "1.9000000000"
}
```

6 • Historical settlement identifiers

Ledger update IDs from the original cBTC acceptance and transfer sequence, recorded in the project repository at the time they were executed. Three faucet transfer offers were accepted by exercising

TransferInstruction_Accept with choice contexts fetched from the DA Utility Registry, followed by a settled transfer through **TransferFactory_Transfer**.

```
// ledger update identifiers
1220c66531a3dd8369c94fb6fdfee6b43f22b1c8fc9867f632e8ce77be4a4fbe3c
1220f79f7d18ff74a013f9c7ce11edf34dba1aeb8c0516b82de4be436344aecb3

12203c83a812b556fa9dd5159422968b0fa0fbe2c0139f0bd60f437ec732bc0258e6
```

7 • Reproducing this query

Any reviewer granted read rights to the party above can reproduce every figure in this document with three read-only calls against the participant node. No state is modified.

```
# 1 – obtain an access token (OAuth 2.0 password grant)
POST ${TOKEN_URL} grant_type=password scope="openid daml_ledger_api"

# 2 – current ledger end
GET ${LEDGER}/v2/state/ledger-end
  → {"offset": 511565}

# 3 – active contracts at the Selkie party
POST ${LEDGER}/v2/state/active-contracts
  { "activeAtOffset": 511565,
    "filter": { "filtersByParty": { "c699b723-...": { "cumulative": [] } } } }
  → 81 active contracts
```

OPEN VERIFICATION OFFER

We will grant read access to this party, or run the query live on a call, at the reviewer's request. The full source is public at github.com/martinvibes/Selkie, and the product can be exercised immediately by replying to [@SelkiePay](#) on X or messaging [@selkiepay_bot](#) on Telegram.
